

Workplace Safety Consultation – Ergonomics best-practices

Resident ambulation made easier, safer for residents and staff members

Ceiling-mounted lift systems have been installed and used for restorative mobility activities for both long-term residents and short-term rehabilitation patients. The systems prevent unexpected falls of residents by providing support whenever it is needed.

Ceiling track mounted in a hallway establishes a 100-foot restorative walking area for residents.

Staff members can allow residents to walk without fear of the resident suddenly falling to the floor.
